# Bibliography

# What is a REST API?

- REST/RESTful = REpresentational State Transfer
- Communication is stateless = the server does not keep track of the context
  - State is only kept by the client
  - Easy to scale
  - Allows good fault tolerance
  - Easy to implement
- REST is not a standard
- REST is a software architecture style (based on the Web)

# General principles

- REST terminology

- **CRUD**

- Create, Read, Update, Delete
    - A REST API has to implement this functions

- **Routing**

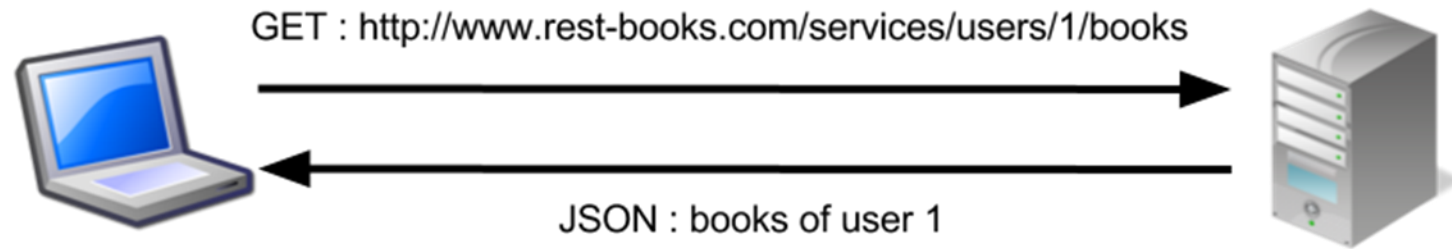

- URLs gives you the path to the data
    - Examples :
      - <https://jsonplaceholder.typicode.com/posts>
      - <http://www.omdbapi.com/?s=batman>

# General principles

- REST Terminology
  - **Mapping** : Association a CRUD function and a REST Method

REST Method	Web Service Function
Create	POST
Read	GET
Update	PUT
Delete	DELETE

# General principles

- Return of a REST API call is text
- JSON : JavaScript Object Notation
- JSON is easy to learn
- JSON is lightweight ( ≠ XML)

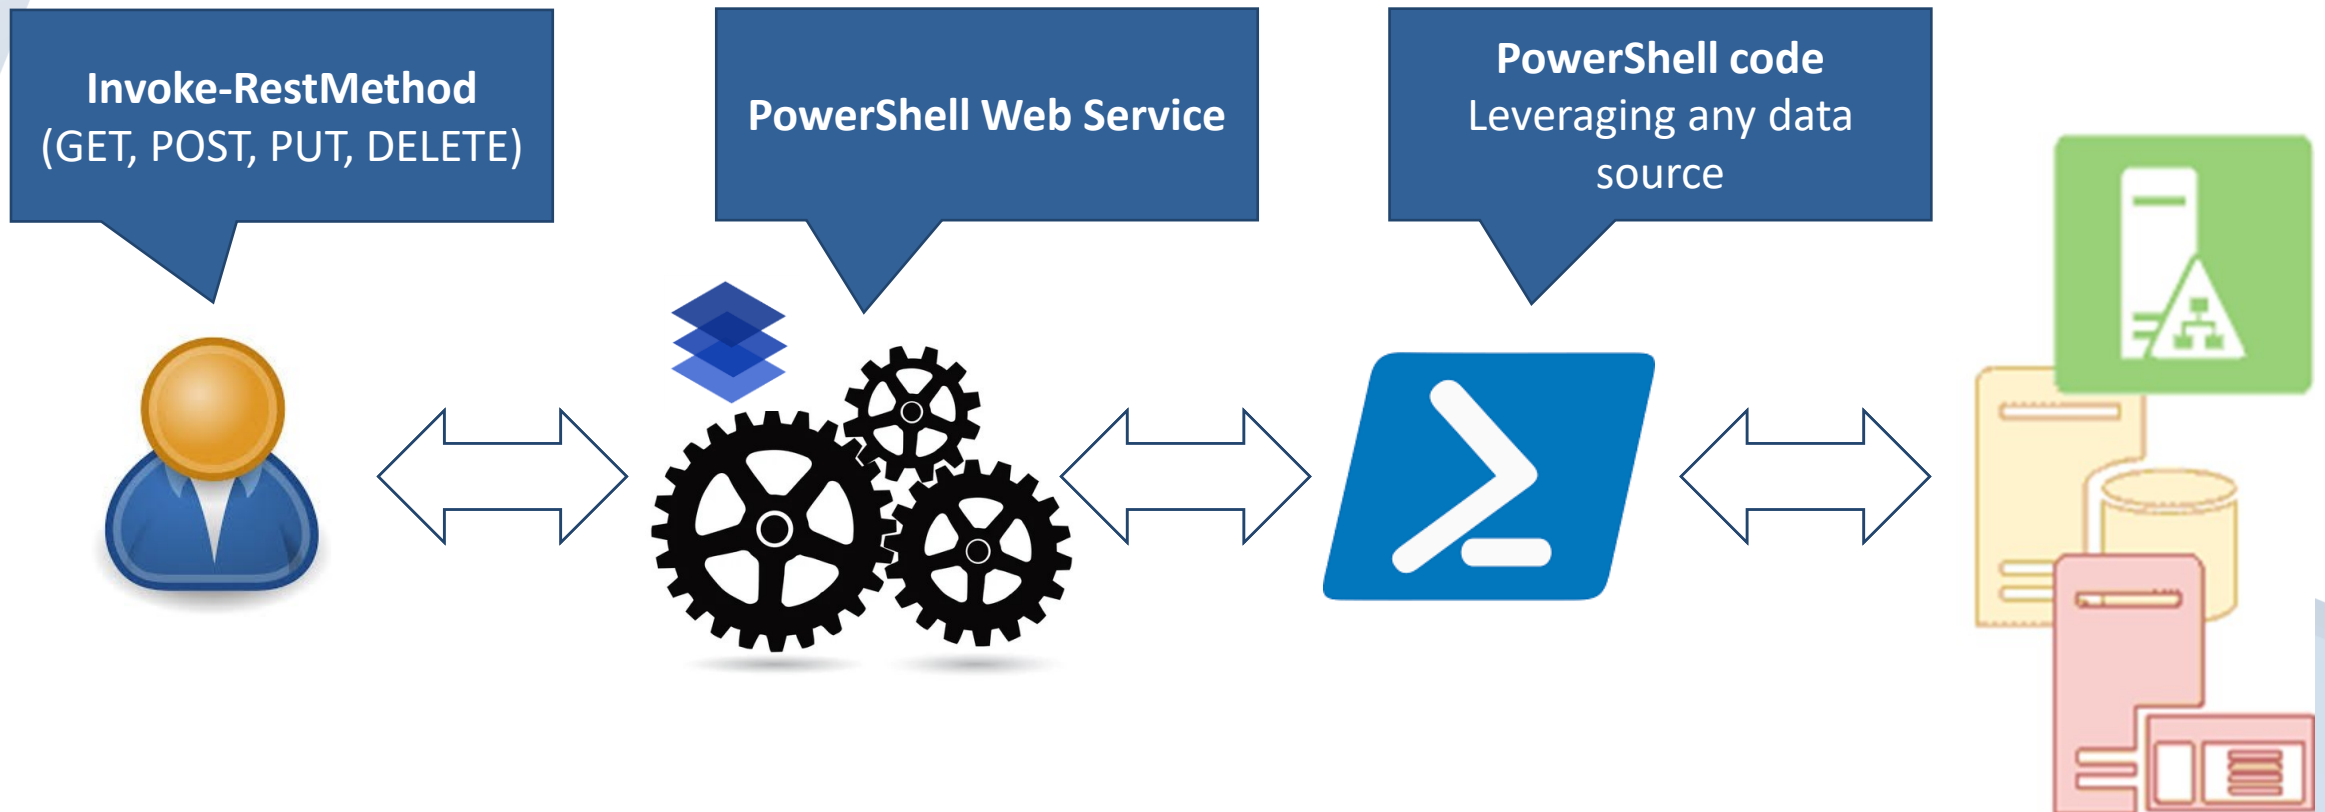

# General principles

## Examples :

- GET: <http://www.rest-books.com/api/user/1>
  - Return information about the user with id 1
- GET: <http://www.rest-books.com/api/user/?id=1>
  - Return information about the user with id 1 (same as above)
- GET: <http://www.rest-books.com/api/user/1/book>
  - Return books of user with id 1
- GET: <http://www.rest-books.com/api/user/1/book/123>
  - Return book 123 of user 1
- DELETE: <http://www.rest-books.com/api/user/1>
  - Delete user 1
